Zagreb, Croatia (CET) | EU Blue Card holder

SUMMARY

- Senior backend engineer, 8 years building and operating cloud-native data platforms in production: distributed services on bare Kubernetes, Kafka pipelines, hybrid-cloud storage, and the observability needed to run them. Java and Spring professionally, Go for new projects.
- Contributor to the OSDU Data Platform since 2021, the open energy-industry data standard, on a 20+ microservices deployment running on Google Cloud and bare Kubernetes with PostgreSQL and MinIO.
- Focus on observability and failure modes: distributed tracing, SLO metrics, and hybrid-cloud storage abstractions that keep multi-service systems legible in production.

TECHNICAL SKILLS

Languages: Go, Java, SQL, Bash

Distributed Systems: Kafka, RabbitMQ, gRPC, REST

Observability: OpenTelemetry, Prometheus, Grafana, Jaeger

Security: OAuth2, RBAC, secrets management

Frameworks: Spring Boot, Spring Data, JPA, JUnit

CI/CD: GitLab CI, GitHub Actions, Maven, Gradle

Databases: PostgreSQL, MongoDB, Redis, Elasticsearch

Cloud: Google Cloud, AWS, Azure, MinIO / S3

Infrastructure: Kubernetes, Docker, Helm, Linux

Architecture: microservices, event-driven, API design

Testing: Mockito, SonarQube, integration and load testing

AI: Claude Code, LLM-assisted development

EXPERIENCE

Senior Software Engineer

EPAM Systems – S&P 500 global leader in product development

Senior Software Engineer – OSDU open energy data platform

April 2019 – Present

Zagreb, Croatia

June 2021 – Present

- Named in The Open Group OSDU Forum's M13 release recognition in two contribution areas: Core Services and Energy Data Standards.
- **135 merged upstream merge requests across 31 repositories** of the OSDU Data Platform (2021–2026), publicly attributable: core services (Storage, Search, Indexer, Schema, File, Dataset), security and compliance (Entitlements, Legal, Secret), provider libraries for **both Google Cloud and Azure**, and ingestion.
- Technical lead on a cross-service Collaboration Context rollout: decomposed delivery into development, testing and operations tracks across six platform services and delegated to engineers from several member organisations.
- Nine platform engagements for two hyperscale cloud providers and five energy-sector clients, covering both the provider side and operator deployments of the same standard.
- Put a geospatial data service behind the platform's central entitlements service, so its data access enforces the same role-based permissions as the core services instead of its own.
- Integrated an on-premise deployment with a 20+ microservice Google Cloud system on bare Kubernetes, adding PostgreSQL and MinIO drivers for hybrid cloud; cut vendor lock-in with a cloud-agnostic storage layer over 6 storage types.
- Platform-wide rollouts and reliability work: a version/build info endpoint collecting 15 parameters from dependent Java microservices, Redis and Elasticsearch via Spring Boot auto-configuration; thread-context cleanup for memory leaks merged across multiple services.

Software Engineer – Retail stores & POS backend platform

April 2019 – June 2021

- Halved checkout time across a 20,000-branch retail network by replacing multi-scan flows with QR codes, cutting operational cost and lifting revenue per store.
- Removed 80 hours per week of manual data entry by generating pick-lists automatically and adding hotkeys for high-frequency categories at self-service checkout.

Software Engineer – Business trips & relocation tracking system

Grid Dynamics – NASDAQ publicly traded enterprise digital transformation leader

August 2018 – April 2019

Saratov, Russian Federation

- Cut travel request processing time by 50% with a trip-tracking service in Java, Spring Boot and PostgreSQL.
- Raised expense-reporting accuracy by 20% with an integration and UI test suite (Spring Test, OpenFeign, Selenium) that caught cross-service contract breaks before release.

EDUCATION

Saratov State University

Bachelor's degree, Information Technology

Saratov, Russian Federation

June 2017
